The compounds of formula I can be present as salts, in particular pharmaceutically acceptable salts. If the compounds of formula I have, for example, at least one basic center, they can form acid addition salts.

- 15 These are formed, for example, with strong inorganic acids, such as mineral acids, for example sulfuric acid, phosphoric acid or a hydrohalic acid, with strong organic carboxylic acids, such as alkanecarboxylic acids of 1 to 4 carbon atoms which are unsubstituted or substituted, for example, by halogen, for example acetic acid, such as saturated or unsaturated dicarboxylic acids, for example oxalic, malonic, succinic, maleic, fumaric, phthalic or terephthalic acid, such as hydroxycarboxylic acids, for example ascorbic, glycolic, lactic, malic, tartaric or citric acid, such as amino acids, (for example aspartic or glutamic acid or lysine or arginine), or benzoic acid, or with organic sulfonic acids, such as (C₁-C₄)-alkyl- or aryl-sulfonic acids which are unsubstituted or substituted, for example by halogen, for example methane- or p-toluene-sulfonic acid. Corresponding acid addition salts can also be formed having, if desired, an additionally present basic center. The compounds of formula I having at least one acid group (for example COOH) can also form salts with bases. Suitable salts with bases are, for example, metal salts, such as alkali metal or alkaline earth metal salts, for example sodium, potassium or magnesium salts, or salts with ammonia or an organic amine, such as morpholine, thiomorpholine, piperidine, pyrrolidine, a mono-, di- or tri lower alkylamine, for example ethyl-, tert-butyl-, diethyl-, diisopropyl-, methyl-, butyl- or dimethyl-

propylamine, or a mono-, di- or trihydroxy lower alkylamine, for example mono-, di- or trimethanolamine. Corresponding internal salts may furthermore be formed. Salts which are unsuitable for pharmaceutical uses but which can be employed, for example, for the isolation or purification of free compounds I or their pharmaceutically acceptable salts, are also included.

Preferred salts of the compounds of formula I include monohydrochloride, hydrogensulfate, methanesulfonate, phosphate or nitrate.

10 All stereoisomers of the compounds of the instant invention are contemplated, either in admixture or in pure or substantially pure form. The compounds of the present invention can have asymmetric centers at any of the carbon atoms including any one of the R substituents.

Consequently, compounds of formula I can exist in diastereomeric forms or in mixtures thereof. The above described processes can utilize racemates, enantiomers or diastereomers as starting materials. When diastereomeric products are prepared, they can be separated by conventional methods for example, chromatographic or fractional crystallization. Preferred compounds are those with the 3R or 4S stereochemistry.

It should be understood that the present invention includes prodrug forms of the compounds of formula I such as alkylesters of acids.

The compounds of the instant invention may, for example, be in the free or hydrate form, and may be obtained by methods exemplified by the following descriptions.

Alternatively, compounds of formula I where R³ is hydrogen can be prepared by first reacting a compound of formula X with an amine of formula III in the presence of a 5 base (e.g., sodium hydride) to provide a compound of formula XI

The compound of formula XI is then converted to compounds of formula I where R³ is hydrogen by methods described for the conversion 10 of compounds of formula IV to compounds of formula I.

Compounds of formula XI where R³ is hydrogen can also be prepared from the ketone of formula XII

15 and the amine of formula III by standard techniques of reductive amination.

The ketone of formula XII can be obtained by standard methodology or by literature procedures, such as those disclosed by P. Sebok and T. Timar, *Heterocycles*, 1988, 27, 2595; P. Teixidor et al., 20 *Heterocycles*, 1988, 27, 2459; A. Benenji and N. C. Coomer, *Tetrahedron Letters*, 1979, 3685; and G. Ariamala and K. K. Subramanian, *Tetrahedron Letters*, 1988, 29, No. 28, 3487-3488.

The bromide of formula X can be prepared from the olefin of formula

by (a) catalytic hydrogenation of the double bond followed by (b) radical bromination using standard methods. The olefin of formula XIII can be prepared by the methods described for the preparation of compounds of formula II.

- 5 Compounds of formula XI where R³ is hydrogen can also be prepared from compounds of formula IV by (a) dehydration of the alcohol with sodium hydride in aprotic solvents such as tetrahydrofuran; and (b) catalytic hydrogenation or reductive amination by sodium cyanoborohydride or sodium triacetoxyborohydride.
- 10 If any of the R substituents, X or Y groups contain reactive groups such as hydroxy or amino that can interfere with the epoxide opening reaction or any other reactions, they should be protected with appropriate protecting groups.
- 15 Compounds of formula II wherein Y is a single bond can be prepared according to D. R. Buckle, et al., *J. Med. Chem.*, 1991, 34, 919.

- 25 Compounds of formula II where Y is oxygen, can be prepared by methods described in the literature, such as by J.M. Evans, et al., *J. Med. Chem.*, 1983, 26, 1582; J.M. Evans, et al., *J. Med. Chem.*, 1986, 29, 2194; R.W. Lüg et al., *Helvetica Chimica Acta*, 1988, 71, 596; European patent 0205292 A2 and PCT patent 87/07607.
- 30 Compounds of formula II where Y is N(R) can be prepared according to PCT patent 85/015(X)X.
- 35 To prepare enantiomers of epoxide II, the olefin of formula XIII is epoxidized with an oxidizing agent such as commercial bleach using a metal catalyst such as chiral manganese catalyst of the formula

depending on the chirality of the 1,2-diaminocyclohexane used in the preparation of a compound of formula XIV as described by Lee et al.

The epoxides of formulae IIa and IIb can then be utilized to prepare the chiral compounds of formula I

Compounds of formula I where R^4 is $OC(O)R^6$ can be prepared from compounds of formula I where R^4 is hydroxy by treatment with an acid chloride of formula XV

in the presence of a base catalyst such as pyridine or triethylamine.

All other compounds of formula I may be prepared by modification of the procedures discussed herein as known by those skilled

in the art. The intermediates used to prepare compounds of formula I are described herein or may be derived from known compounds by those skilled in the art or are commercially available.

The compounds of the present invention can have asymmetric centers at carbons 2-4 of the bicyclic ring. Also, any one of the R's can have an asymmetric carbon. Consequently, compounds of formula I can exist in diastereomeric forms or in mixtures thereof. The above described process can utilize racemates, enantiomers or diastereomers as starting materials. When diastereomeric products are prepared, they can be separated by conventional chromatographic or fractional crystallization methods.

The antiischemic and antihypertensive effects of benzopyran based and related potassium channel openers are usually stereoselective, with the 3S,4R-enantiomer being the more active isomer. However, it has been unexpectedly found that compounds of formula I are "selective antiischemic agents" with the 3R,4S-enantiomer being the more potent isomer. The term "selective antiischemic agent" means that these compounds possess little or no vasodilator activity (i.e., these compounds have IC₅₀ (rat aorta) values greater than that of the known potassium channel activator, cromakalim. Therefore, in the treatment of ischemic hearts, the compounds of the instant invention are less likely to cause coronary steal, profound hypotension and coronary under-perfusion.

The preferred compounds of the present invention are those compounds of formula I where:

- 25 a, b and d are carbon atoms;
- X is alkyl;
- Y is a single bond or -O-;
- R¹ is aryl or heterocyclo;
- R² is -COOR⁸, -CO-amino, -CO-substituted amino,
- 30 -NHCOCH₃, -NHSO₂Me, -NHCONH₂, -NH(C≡NCN)NH₂, imidazole, furan, pyridine, oxazole, hydroxy, -NHCO-substituted amino or -SO₂Me;
- R³ is hydroxy;
- R⁴ and R⁵ are methyl;
- R⁶ is cyano, -NO₂, -(CF₃), halo, alkyl or tetrazol; and

R⁷ is hydrogen.

Compounds of formula I may be used as antiischemic agents, i.e., for the treatment of ischemic conditions such as myocardial ischemia, cerebral ischemia, lower limb ischemia and the like.

5 Thus a composition containing one (or a combination) of the compounds of this invention, may be administered to a species of mammal (e.g., humans) suffering from an ischemic or hypertensive condition.

A single dose, or two to four divided daily doses, provided on a basis of about 0.001 to about 100 mg per kilogram of body weight per day, 10 preferably about 0.1 to about 25 mg per kilogram of body weight per day is appropriate. The substance is preferably administered orally, but parenteral routes such as the subcutaneous, intramuscular, intravenous or intraperitoneal routes or any other suitable delivery system, such as intranasal or transdermal routes can also be employed.

15 As a result of the potassium channel activating activity of the compounds of this invention, these compounds are also useful in the treatment of cardiovascular disorders and any disorders associated with smooth muscle contraction. For example, compounds of the present invention are useful as therapy for congestive heart failure, therapy for 20 peripheral vascular disorders (e.g. Raynaud's Disease), therapy for pulmonary hypertension, as anti-anginal agents, as antifibrillatory agents, and in limiting myocardial infarction.

Compounds of the present invention are additionally expected to be useful in the treatment of central nervous system disorders (e.g., 25 Parkinsonism, as anti-tremor agents, epilepsy), in therapy for renal failure, in therapy for urinary incontinence, as anti-diarrheal agents, in therapy for pre-eclampsia, dysmenorrhea and premature labor, for the treatment of male impotence, as well as for the promotion of hair growth (e.g., in the treatment of male pattern baldness), and as anti-asthmatic agents.

30 The compounds of this invention can also be formulated in combination with a diuretic such as chlorothiazide, hydrochlorothiazide,

musolimine, burnetanide, triamterene, amiloride and spironolactone and salts of such compounds, angiotensin converting enzyme inhibitors such as captopril, zofenopril, fosinopril, enalapril, ceranopril, cilazopril, delapril, pentopril, quinapril, ramipril, lisinopril, and salts of such compounds, thrombolytic agents such as tissue plasminogen activator (tPA), recombinant tPA, streptokinase, urokinase, prourokinase, and anisoylated plasminogen streptokinase activator complex (APSAC, Eminase, Beecham Laboratories), or calcium channel blocking agents such as nifedipine or diltiazem. Such combination products if formulated as a fixed dose employ the compounds of this invention within the dose range described above and the other pharmaceutically active agent within its approved dose range.

The compounds of formula I, and combinations thereof, can be formulated, as described above, in compositions such as tablets, capsules or elixirs for oral administration, in sterile solutions or suspensions for parenteral administration, and may also be administered via transdermal patch or nasal inhalation solutions. About 10 to about 500 milligrams of a compound of formula I is compounded with physiologically acceptable vehicle, carrier, excipient, binder, preservative, stabilizer, flavor, etc., in a unit dosage form as called for by accepted pharmaceutical practice. The amount of active substance in these compositions or preparations is such that a suitable dosage in the range indicated is obtained.

The following examples and preparations describe the manner and process of making and using the invention and are illustrative rather than limiting. It should be understood that there may be other embodiments which fall within the spirit and scope of the invention as defined by the claims appended herein.
